Insert Your Article's Title Here

[In the initial submission, omit all the following kinds of author information to ensure anonymity during peer review. After acceptance, please add all the author information. As of 2026, CMJ no longer includes full postal addresses.]

Jane Doe*, Joe Bloggs†, and Hong Gil-dong§

*Berkeley, California, USA

†University of Glasgow, UK

§Yonsei University, Seoul, Korea

jdoe@email.com, j_blow@email.com, g-d.hong@email.com

http://optional-url-if-there-is-a-website-directly-related-to-your-article

[You should not need any LaTeX packages beyond what are included in the template .tex document. If you feel you absolutely need additional packages, separate them from default CMJ packages and add comments explaining why you have added them. Be sure to read the instructions in the comments of the template .tex document.]

Abstract

Insert abstract here, typically about 150–200 words.

Introduction

Introductory body text comes here. The title can be "Introduction," "Background," or perhaps something more interesting. Replace this template's introductory text with the text for your article.

Starting each sentence on a new line in the LaTeX source can be helpful for the editors in preparing an article for submission to MIT Press.

Use of additional packages, beyond what are included in this template and the cmjStyle.sty documents, should not be necessary and is discouraged.

For other style questions, see the instructions for authors at https://direct.mit.edu/comj/pages/submission-guidelines and previously published articles at https://direct.mit.edu/comj/issue. Most issues include a freely downloadable feature article. Questions may be directed to cmj-editor@mit.edu; please start the subject line with [CMJ MS].

Format for Heading-A Style

Insert body text here. Use the Heading-A style for headings of major sections. Note that CMJ does not use section numbers for any level of heading. You can, however, refer to sections by name. In LaTeX, the `nameref` directive is helpful, to reference other sections. For instance, this sentence refers to something that will be discussed later in the Figures section.

Format for Heading-B Style

Insert body text here. Use the Heading-B style for headings of subsections.

Format for Heading-C Style

Insert body text here. Use the Heading-C style for headings of sub-subsections.

Figure 1. Insert Figure caption here. Figure captions should include enough information to give casual readers some idea what the figure is about, without repeating every detail from your article. Typically, anything from one to three sentences may be appropriate, although this may vary.

Figures

In the initial manuscript submission, you should include figures inline with the text for ease of reading during the review process. All figures will need to be sufficiently high-resolution and meet the specifications under "Art" at https://direct.mit.edu/comj/pages/submission-guidelines, preferably in the initial submission but at least following acceptance. As of 2025, figures are no longer required to be grayscale (monochrome); full-color figures are welcome. Figures must be referenced in the text, either directly in the text or as a parenthetic aside, e.g., "(see Figure 1)." Do not reference figures with terms of relative location like "above" or "below," however. When an article is typeset, figures are never embedded in the text and you do not know exactly where the image will appear in relation to your text. For the review process, simply place the LaTeX figure definition immediately after the first paragraph referring to the image.

Also note that for the final version of your article, MIT Press requires your artwork in either PDF (vector graphics) or TIFF (raster) formats. On the other hand, LaTeX usually only supports PDF, PNG, and JPEG formats for images. The upshot of this is that authors using LaTeX might need to submit images in two formats. The good news is that most LaTeX implementations provide utilities for converting from the formats used by MIT

(a) *(b)* *(c)*

Figure 2. Example of a multipart figure using variations of Figure 1. The examples here are a simple rotation (a), an upside-down version (b), and a counter-clockwise rotation (c).

Press to those used by LaTeX.

As noted in the caption to Figure 1, captions should provide sufficient explanatory information to be understood even by those readers who may be scanning the artwork before studying your text in depth. On the other hand, you don't want to repeat your text word-for-word in the caption, and the caption will probably omit some details.

Multipart Figures

Multipart figures must be submitted as separate images. So, if you have Figures 2a, 2b, and 2c, each of those should be a separate image file with "2a," "2b," etc. in the file name. Do not include the part labels "a," "b," etc. in the actual images; the typesetter will add these in a standard style consistent across all articles and all issues of CMJ.

Also, CMJ style does not allow for subcaptions (that is, captions for the individual subfigures). Instead, include any necessary information about the subfigures in the main figure caption, following the example in Figure 2.

Table 1. Sample Table with Title

Column	Headers	Might Look	Like This
one	2	3	IV
five	6	7	VIII
nine	10	11	XII

Although table footers are often not necessary, the source code shows how to generate one using an unnumbered caption in LaTeX. Keep the actual title short and only use a footer if more detail is needed.

Tables

Tables must also be cited in the text, as with Table 1. Tables in *CMJ* do not have "captions" as such. A table has a title, which should be concise. If absolutely necessary for understanding the table, additional information can be included in a footer, although that is not required. When typeset, tables will not have vertical rules.

Equations

You can insert short equations and mathematical expressions inline with the text like this: $a^2 + b^2 = c^2$.

For longer equations and for complex where lists, you can use the LaTeX `equation` environment, as in the following example:

$$\Psi_N^{n+1} = m_N^{(-)}\Psi_{N-1}^n + m_N^{(0)}\Psi_N^n + q_N\Psi_N^{n-1} \tag{1}$$

where

$$\begin{aligned} m_N^{(-)} &= \frac{\lambda^2}{2\tau}\left(S_{N+1} + 2S_N + S_{N-1}\right), \\ m_N^{(0)} &= \frac{1}{\tau}\left(2 - \frac{\lambda^2}{2}\left(S_{N+1} + 2S_N + S_{N-1}\right)\right), \\ q_N &= \frac{1}{\tau}\left(\frac{\gamma^2 k^2}{2h}\left(S_{N+1} + S_N\right)\left(\frac{\alpha_1}{k} - \alpha_2\right) - 1\right), \end{aligned}$$

and where

$$\tau = \frac{\gamma^2 k^2}{2h}\left(S_{N+1} + S_N\right)\left(\frac{\alpha_1}{k} + \alpha_2\right) + 1.$$

Equations do not need to be numbered. You can use the `equation*` environment to avoid numbering. If you refer to the same equation in different parts of your text, however, you will need to use equation numbers. *CMJ* style for citing equations is "Equation 1" (note capitalized "Equation" and the nonbreaking space before the number). Using the \eqref{} directive from the amsmath package breaks CMJ style, so we ask authors not to use it (or to redefine the macro to match *CMJ* style, but that's probably more effort than it's worth).

Code Examples

Most code examples require the width of a full page, whereas, in the final typeset copy used by *CMJ*, the body text is set in two columns and there is no practicable way to insert full-page-width code in the middle of a page. For this reason, code examples are almost always rendered as figures, as in Figure 3. Figures, on the other hand, can extend over the width of an entire page.

```
Use this style for program code,
for example:
main() {
    printf("Hello World\n");
}
% Extended code examples that are likely to be too wide
% for the two-column page layout used by CMJ should be
% prepared as figures, using text rather than an image format.
```

Figure 3. Example for including a code sample. You may also a package for "pretty printing" (e.g., the `listing` *package). But remember that* CMJ *is printed in black-and-white, so anything involving color must be avoided.*

Citations and Using References

Some examples for citing references in the text follow. Single authors, listed separately in text: for instance, Anonymous (2008) or Belevitch (1968). Multiple authors, in text: Vergez and Rodet (2000); Atig, Dalmont, and Gilbert (2004). Parenthetic citations: (Theremin 1999; Atig, Dalmont, and Gilbert 2004; Castine et al. 2024). Note that in the last example *CMJ* style lists citations in chronological order,

Citation as a single parenthetic note, including supplementary information: (see also Zicarelli 2000, which includes detailed diagrams).

Please don't type parentheses around a `citet` directive when you want a citation in parentheses—that's what the `citep` family of directives are there for.

When making your final submission, please review all the references in your .bib file to make sure they are complete and accurate.

Please consult the enclosed .bst file and the BibTeX documentation for further examples.

Other Points of Style

For other style questions, visit https://direct.mit.edu/comj/pages/submission-guidelines to see the submission guidelines and previously published articles at https://direct.mit.edu/comj/issue. Most issues include a freely downloadable feature article. Questions may be directed to cmj-editor@mit.edu; please start the subject line with "[CMJ MS]".
